

①

Udemy Python, ML NLP, DL Bootcamp Krush Naik Course

~~Intro~~

Module 18 $\Rightarrow$ Introduction
to Flask Framework.

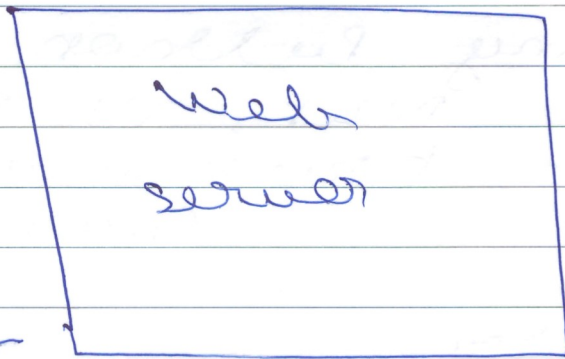

Flask Framework

- ① WSGI $\Rightarrow$ Web Server Gateway Interface
- ② Jinja2 Template Engine

Flask :- Web Framework
which is created
using the Python
Programming Language.

$\Rightarrow$ Before moving further
we need to understand
Web Server :-

P-7.0.

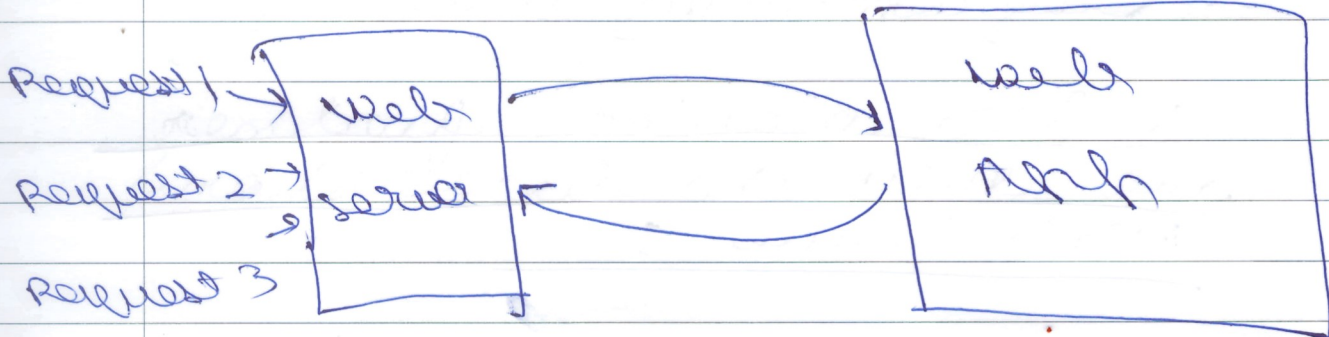

where we deploy web applications

Different cloud platforms including :-
AWS ECS
Azure APP
APACHE

these are used based on the requirements.

suppose we have a web app deployed on a web server :-

P.T.O

⇒ Hence to redirect this request to web Alpha we follow the protocol.

• This protocol is called gateway Interfacing (WSGI) protocol.

→ Hence, this is called as protocol.

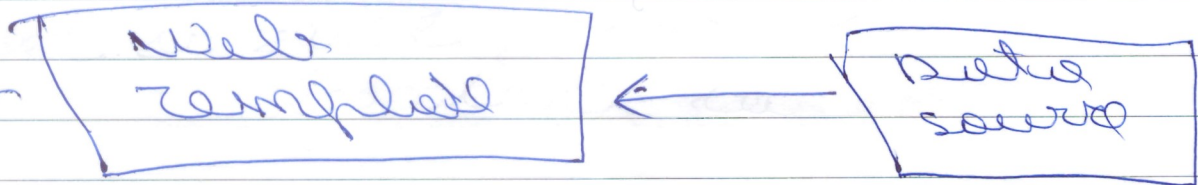

The WSGI server will send the request to the origin or server then the web server will

→ Hence the flask framework will work as WSGI.

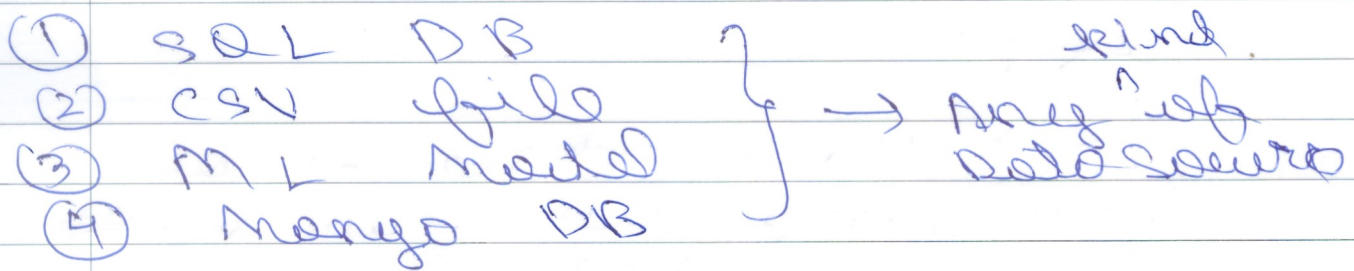

② Twig 2 Template Engine

Twig 2 is basically a web template engine:-

- It combines a web template with a data source.

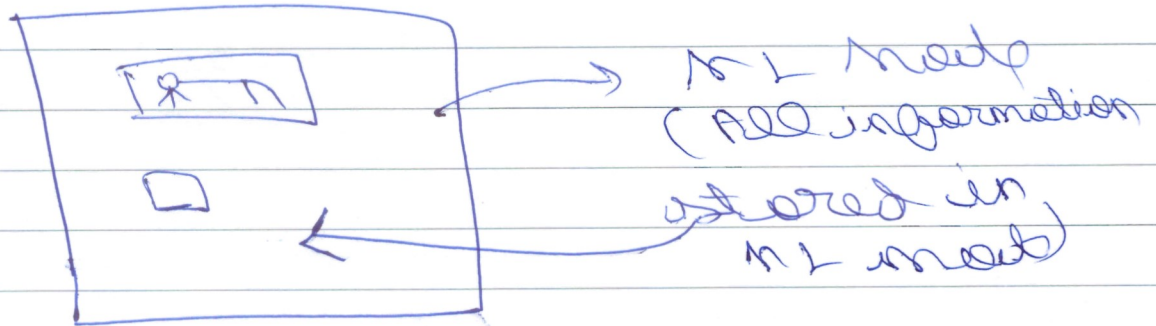

- Now the data source can be of many types:-

- From this kind of data source, we will be getting all the information on the web template.

- The entire web template will get loaded.

⇒ We take the example of an ML model:
In that, we come to see that :-

or a model template where we upload the image.

Now the image is given to the model to see whether it is a cat or dog.

→ That information is stored in ML model & hence, we receive the information.

Basically we are combining multiple layers of a neural network.

we are creating a dynamic new page.
