Sec-30 Support vector machines

lec 1: Introduction to Support vector machine

lec 2: - Soft margin & Hard margin

Support vector machine
ML Algorithms

It is used for both top functions:-

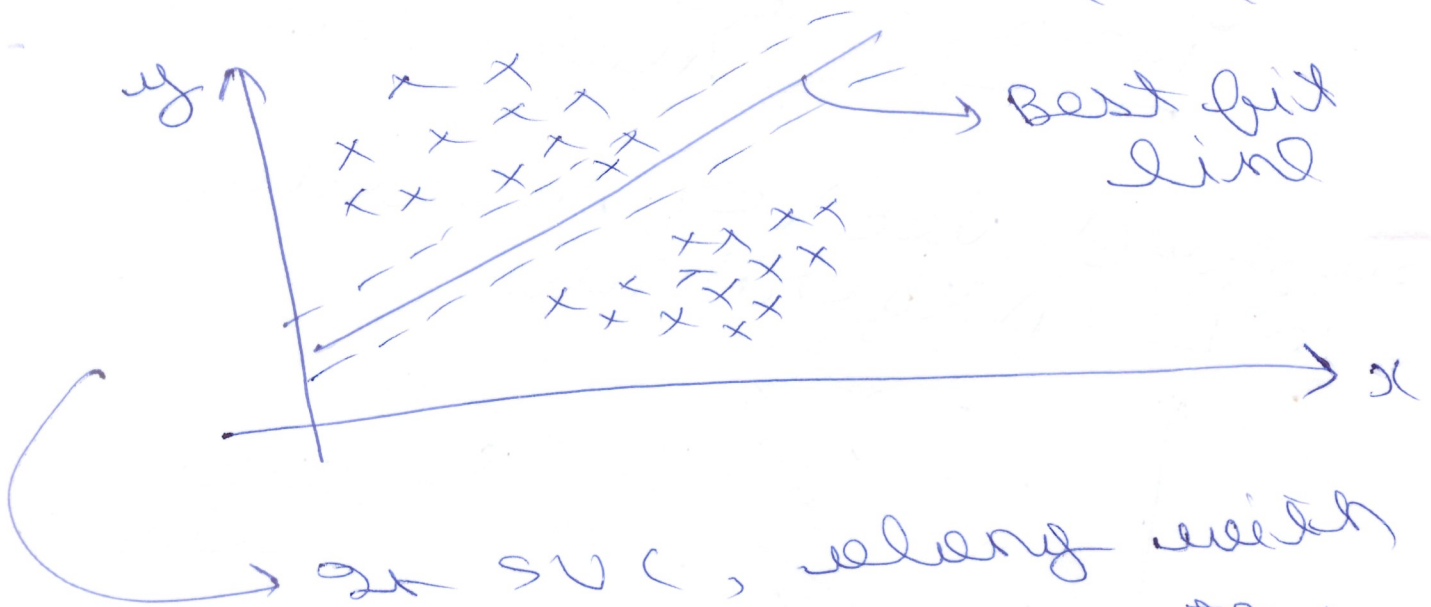

- (1) SVC (Support vector classifier)
- (2) SVR (Support vector regressor)

In the Logistic regression (2)
we used to create a 3D
model.

we categorize the data
points into categories.

In Support vector machine
the discussion goes as:

① Support vector classifier
(SVC)

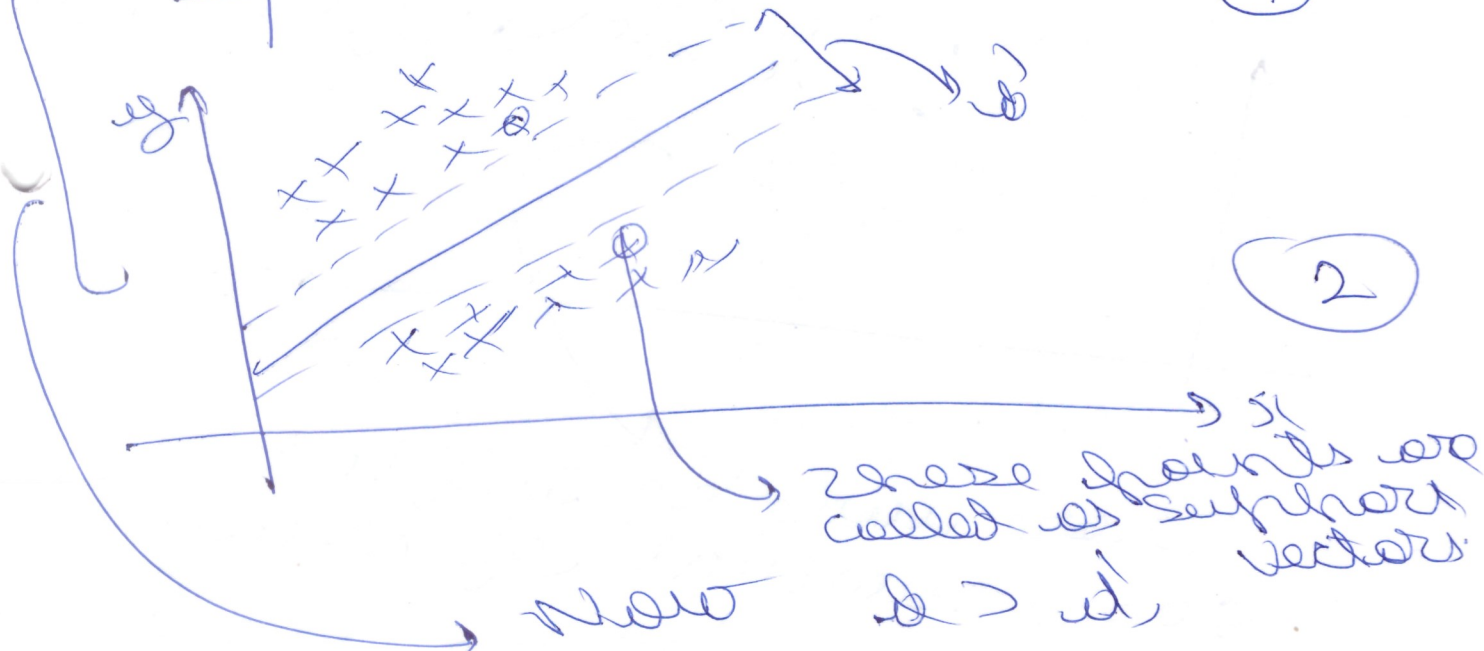

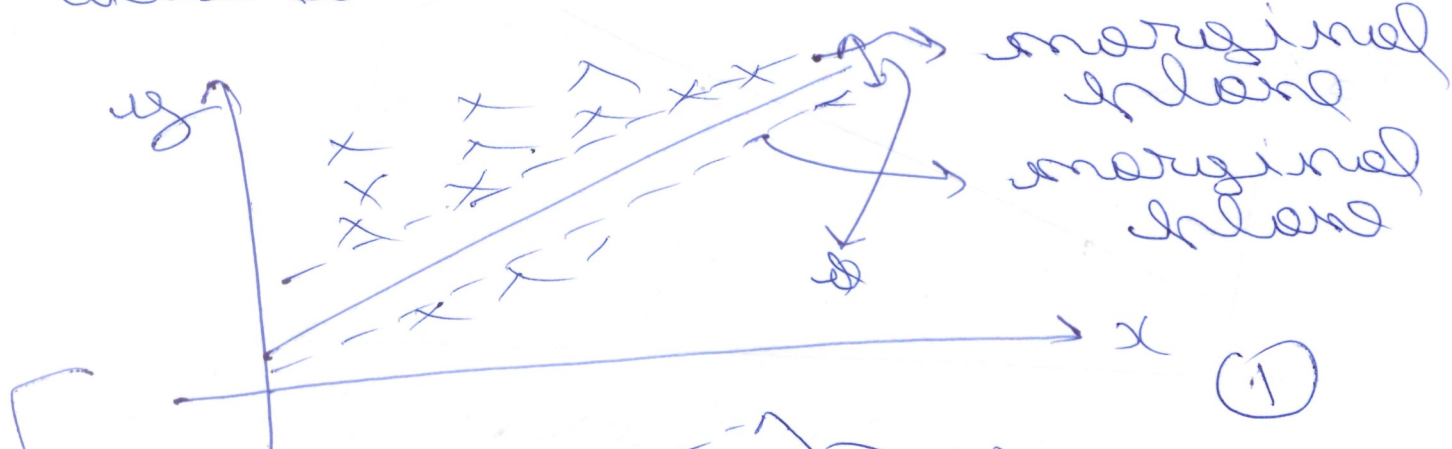

In SVC, along with
best fit lines, we try
creating 2 more lines
known as marginal lines

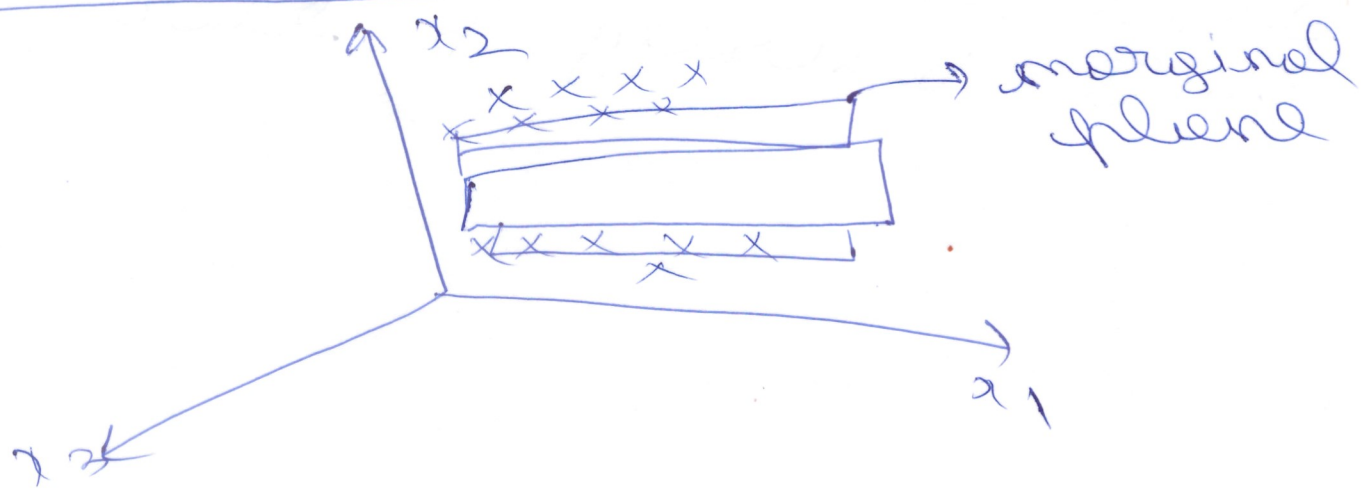

Hence we also create
the marginal planes.

level of margin must be maximum

3

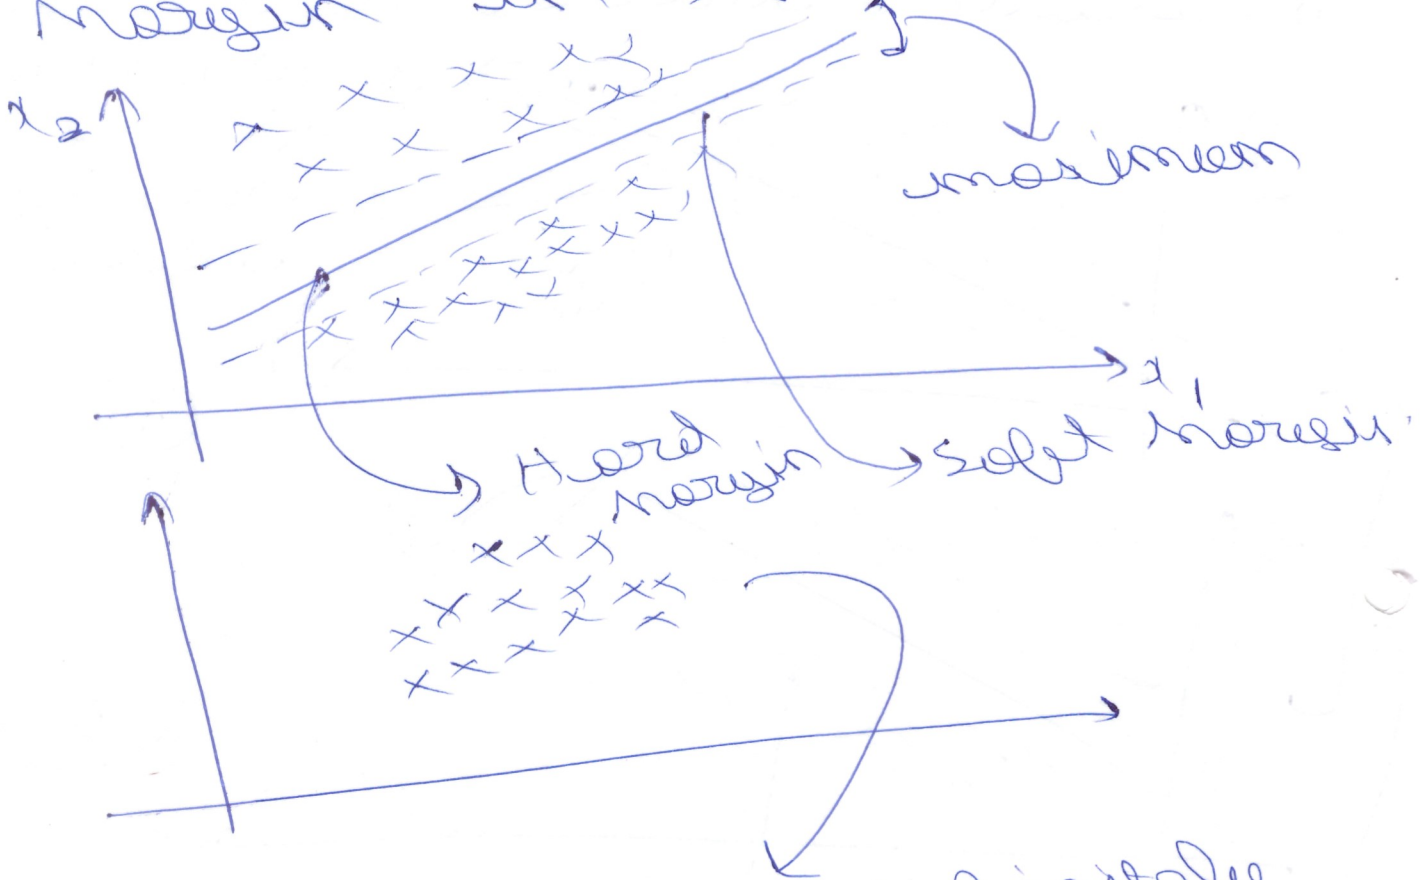

Hence, we select the ① with best fit along with margin level to do classification.

4

⇒ Soft margin and Hard margin in SVM.

There will be definitely some amount of errors.

Here there will be more such errors.

Soft margin basically mean that some amount of errors will be allowed.
