~~Git~~

Udemy ML, DL, NLP
course
Krish Naik sir

Git for beginners

Git is the free & open source distributed version control system that's responsible for everything Git hub related that happens locally on your computer.

- Basic commands

Initializing the git :-
git init

---

git

customizing the Git
the Git customization
can be done
git configs --global user.name "Chaitanya Rej"

git configs --global user.email "robson@gmail.com"

Now the further commands these like :-

(1) git add README.md

(2) git status

↳ Hence these commands were there for tracking the git and also for initializing & telling it tracked

git commit -m "first commit"

(1) . git commit -m "This is the first commit"

(2) ~~git~~ git status

(3) git branch

↳ Name it's the master

git branch -M main

For connecting the repository :-

git remote add origin https://github.com/manish581/Krish-Naik-GIT-Tutorials-.git

git status

git push origin main

Now suppose, we make some changes :-

- Here if suppose, we made some changes, so basically, we can either restore the previous file or change the new one.

git restore README.md (4)

git status

git add .

on branch main

Git Merge, Push, Log with Commands

(1) git init
initializing an existing directory as a Git Repository

(2) git clone [url]

(3) git commit -m "[descriptive message]"

git restore --staged "New Test Document.

Merge Branches and resolving
